Show the email your customers actually see.

An email can look right in an editor and change in Gmail, Outlook or an iPhone inbox. MailSlurp captures the delivered email across supported clients and devices so teams can compare layout, images, text and buttons before a campaign goes out.

Product illustration. Record and show your own test results.

Who this helps

Ecommerce owners, email marketers and agencies preparing campaigns, newsletters, welcome emails or abandoned-cart flows.

How MailSlurp works

Choose clients in MailSlurp, copy your special render address and send your campaign to it. Receipt starts the screenshots automatically. Open the completed captures to see the same email in each selected client.

What to create

Record a campaign check: send a test from your email platform, compare two or three completed client captures, and explain one useful finding. If you change the email, send it again and compare the real results.

Get your free demo account

Email kipling@mailslurp.dev with your channel and topic. For an agreed project, Kipling confirms the features, finite allowance, expiry and renewal behavior before free access is set up. Follow the reply before recording; phone rentals are agreed separately.

Request your free demo account

Run your demonstration

Use a campaign you can show publicly, or the MailSlurp demo newsletter in the ZIP. Have access to its email editor and test-send controls. Ask Kipling to enable device rendering and confirm your render allowance. Choose clients available in your account; dark mode is a separate supported target.

1. Choose a campaign and explain the intended result

Show the email in your ESP editor. Point out the main image, headline, button and any columns. Explain how you expect them to look on a phone. Use realistic preview/profile data if the campaign has personalization.

2. Select your clients in MailSlurp

Open Device Previews and Start new render. Expand the target selector, choose the available mobile and desktop clients you want to compare, review the credit requirement, then click Use selected. Add a supported light/dark pair if appearance is your topic.

3. Copy the render address and send your email

Copy the complete address shown for this selection. In your ESP, send the campaign test to that address. In Klaviyo's HTML editor use Preview, Send as an email, Send To and Preview Now; its visual editor uses the profile-preview test-send controls.

4. Wait for receipt and completed captures

After the ESP confirms sending, return to MailSlurp and click I have sent my email. Open View results once the message is detected. Check which targets have finished before presenting a comparison.

5. Compare the actual email

Open full captures from the same send. Check column stacking, image visibility, text wrapping, button labels and spacing. For dark mode, inspect the message body and button colors, not just the inbox toolbar.

6. Make one useful change and send again

If a real issue appears, explain your change in the ESP and send a fresh test using the same comparison targets. Show the new captures before saying it is fixed. If the original already looks good, explain what passed rather than inventing a defect.

If the result is not ready

No result yet? Confirm the complete render address and the ESP's send confirmation, then check receipt and target states. A successful send is not a completed render. Avoid duplicate sends while the first is unresolved. HTML paste and EML import are alternative workflows in the docs.

Name the clients you actually tested. A desktop Mac Apple Mail capture is different from iOS Mail. Appearance testing shows how a message looks; use a separate inbox-placement test to establish where it lands.

Make a useful walkthrough

Use these scenes for a written walkthrough or a 90-second video. A video is optional. Speak in your own voice and describe only the result you actually get. Give readers or viewers enough detail to follow the setup.

Time	Show on screen	Suggested narration
0-12s	Campaign in the ESP editor	This campaign looks ready here. Let's check what subscribers will see in their email apps before it goes out.
12-28s	MailSlurp target selection and address	I'm choosing the clients my audience uses. MailSlurp gives me an address to send this campaign to.
28-40s	Actual test-send confirmation	I send from the same email platform. MailSlurp receives the message and captures it in those clients.
40-70s	Two completed captures, opened clearly	Here is the same email in each client. I'm checking the button, images and text. Describe the difference or successful check you can actually see.
70-90s	Finding, optional completed retest, then CTA	This is the check I would repeat before the next campaign. Viewers can explore device rendering through the link in my description.

For a longer walkthrough

For a 5-8 minute tutorial, spend the first minute explaining the campaign and audience, two minutes selecting targets and sending, and two minutes inspecting complete captures. Use the remaining time for a genuine change and retest, or explain why the original passed. Show waiting time honestly if you edit it out.

A title you can adapt

Before you send your next Klaviyo campaign: check the real email on mobile and desktop

A description you can adapt

I sent a campaign to MailSlurp and compared the delivered email across my selected clients. Watch the walkthrough to see what I checked before sending. Explore MailSlurp using the link in my description.

Replace the description's product link with the referral URL agreed with Kipling. Include a clear disclosure such as: "I may earn a commission if you buy through my link." Also disclose any paid sponsorship or free demo access.

Watch, prepare and share

These @MailSlurp examples show the product in use. Follow the current written guide for exact controls and code, and use the videos to plan your own explanation.

Download the PDF, example and brand assets (ZIP)

Watch or download the supplied product demo

The companion ZIP includes this PDF, a sample HTML newsletter with sending instructions, MailSlurp logos and a preview from the supplied product demonstration. Record your own result, or credit MailSlurp when using supplied footage.

Your commission

Earn 25% on every eligible payment within 12 months of their first payment from customers you refer. The attribution window is 60 days. Commissions mature after 45 days; new creator payouts are reviewed monthly from EUR50. Eligible payments include subscription and usage charges after discounts; usage-only payments qualify within the eligibility window and an annual invoice counts once. Free signups alone do not earn commission. Refunds and chargebacks are deducted. PayPal or bank transfer is available; invoicing can be arranged. Any provider, bank or FX charges are confirmed before the first payout. Joining is free, with no paid plan or minimum sales commitment. Confirm your approved link and full terms with Kipling before publishing.

Before you publish

- Show the campaign, selected targets and completed result together.

- Keep mobile, desktop and dark-mode labels accurate.

- If using the supplied newsletter, identify it as a demo, not a client campaign.

Ask Kipling for your referral link and any tracked customer coupon. Agree the destination, discount and validity before sharing. Free demo access is for your recording; customer offers are arranged separately.
